This book presents a critical analysis and examination of the major theories and social issues in the social construction of aging and death. It is concerned with the impact of death and places how our experiences of death are transformed by the roles that truth and discourse about aging play in everyday life. A major element of the book is an examination of the way in which groups and individuals employ specific representations of mortality in order to construct meaning and purpose for life and death. To accentuate this, the book provides an investigation into the social construction of death practices across time and space. Special attention is given to the notion of death as a socially accomplished phenomenon grounded in a unique sociological introduction to the meaning of death throughout history to the present. The purpose of this book is to critically inform debates concerning the abstract and empirical features of death examined through the lens of sociological perspectives. This book explores the emergent biomedical dominance relating to ageing and death. An alternative is advocated which re-interprets ageing for Graduate schools. This innovative book explores the concept, history and theory of aging and its relationship to death. Traditionally, many books have focused on older people dying of 'natural causes', a biomedical explanatory framework. This book looks at alternative social theories and experiences with aging and relate to death in different countries, victims, crime, imprisonment and institutional care. Are these deaths avoidable? If so, what are the solutions the book addresses. This is one of the first books that re-interprets aging and its relationship of examples of death. It will be of essential reading for graduate students and researchers in understanding these different examples of aging and death across the globe. Medical Centers. Charts and tables. Green Healthcare Institutions : Health, Environment, and Economics, Workshop Summary is based on the ninth workshop in a series of workshops sponsored by the Roundtable on Environmental Health Sciences, Research, and Medicine since the roundtable began meeting in 1998. When choosing workshops and activities, the roundtable looks for areas of mutual concern and also areas that need further research to develop a strong environmental science background. This workshop focused on the environmental and health impacts related to the design, construction, and operations of healthcare facilities, which are part of one of the largest service industries in the United States. Healthcare institutions are major employers with a considerable role in the community, and it is important to analyze this significant industry. The environment of healthcare facilities is unique; it has multiple stakeholders on both sides, as the givers and the receivers of care. In order to provide optimal care, more research is needed to determine the impacts of the built environment on human health. The scientific evidence for embarking on a green building agenda is not complete, and at present, scientists have limited information. Green Healthcare Institutions : Health, Environment, and Economics, Workshop Summary captures the discussions and presentations by the speakers and participants; they identified the areas in which additional research is needed, the processes by which change can occur, and the gaps in knowledge. The SIGI 2021 Regional Report for Africa provides regional analysis on how discriminatory social institutions, such as formal and informal laws, social norms and practices, continue to constrain women's empowerment and restrict their access to opportunities and rights. It gives new evidence on the impact of these discriminatory social institutions on three key dimensions of women's empowerment across the region: their physical integrity, their economic situation and their political voice, leadership and agency. The Social Security Administration (SSA) administers two programs that provide benefits based on disability: the Social Security Disability Insurance (SSDI) program and the Supplemental Security Income (SSI) program. This report analyzes health care utilizations as they relate to impairment severity and SSA's definition of disability. Health Care Utilization as a Proxy in Disability Determination identifies types of utilizations that might be good proxies for "listing-level" severity; that is, what represents an impairment, or combination of impairments, that are severe enough to prevent a person from doing any gainful activity, regardless of age, education, or work experience. This book investigates the causes and consequences of congressional attacks on the US Supreme Court, arguing that the extent of public support for judicial independence constitutes the practical limit of judicial independence. First, the book presents a historical overview of Court-curbing proposals in Congress. Then, building on interviews with Supreme Court justices, members of Congress, and judicial and legislative staffers, the book theorizes that congressional attacks are driven by public discontent with the Court. From this theoretical model, predictions are derived about the decision to engage in Court-curbing and judicial responsiveness to Court-curbing activity in Congress. The Limits of Judicial Independence draws on illustrative archival evidence, systematic analysis of an original dataset of Court-curbing proposals introduced in Congress from 1877 onward and judicial decisions. Discussions of informed consent, confidentiality, and advance directives—core concepts integral to every surgeon-patient relationship—open the volume. Seven chapters tackle the ethical issues in surgical practice, covering the full range of surgical patients—from emergency, acute, high-risk, and elective patients, to poor surgical risk and dying patients. The book even considers the special relationship between the surgeon and patients who are family members or friends. Chapters on surgical research and education address innovation, self-regulation in practice and research, and the prevention of unwarranted bias. Two chapters focus on the multidisciplinary nature of surgery, including the relationships between surgery and other medical specialties and the obligations of the surgeon to other members of the surgical team. The economic dimensions of surgery, especially within managed care, are addressed in chapters on the surgeons financial relationships with patients, conflicts of interest, and relationships with payers and institutions. The authors do not engage in abstract discussions of ethical theory; instead, their discussions are always directly relevant to the everyday concerns of practicing surgeons. This well-integrated volume is intended for practicing surgeons, medical educators, surgical residents, bioethicists, and medical students. What are the limits of human rights, and what do these limits mean? This volume engages critically and constructively with this question to provide a distinct contribution to the contemporary discussion on human rights. Fassbender and Traisbach, along with a group of leading experts in the field, examine the issue from multiple disciplinary perspectives, analysing the limits of our current discourse of human rights. It does so in an original way, and without attempting to deconstruct, or deny, human rights. Each contribution is supplemented by an engaging comment which furthers this important discussion. This combination of perspectives paves the way for further thought for scholars, practitioners, students, and the wider public. Ultimately, this volume provides an exceptionally rich spectrum of viewpoints and arguments across disciplines to offer fresh insights into human rights and its limitations.
